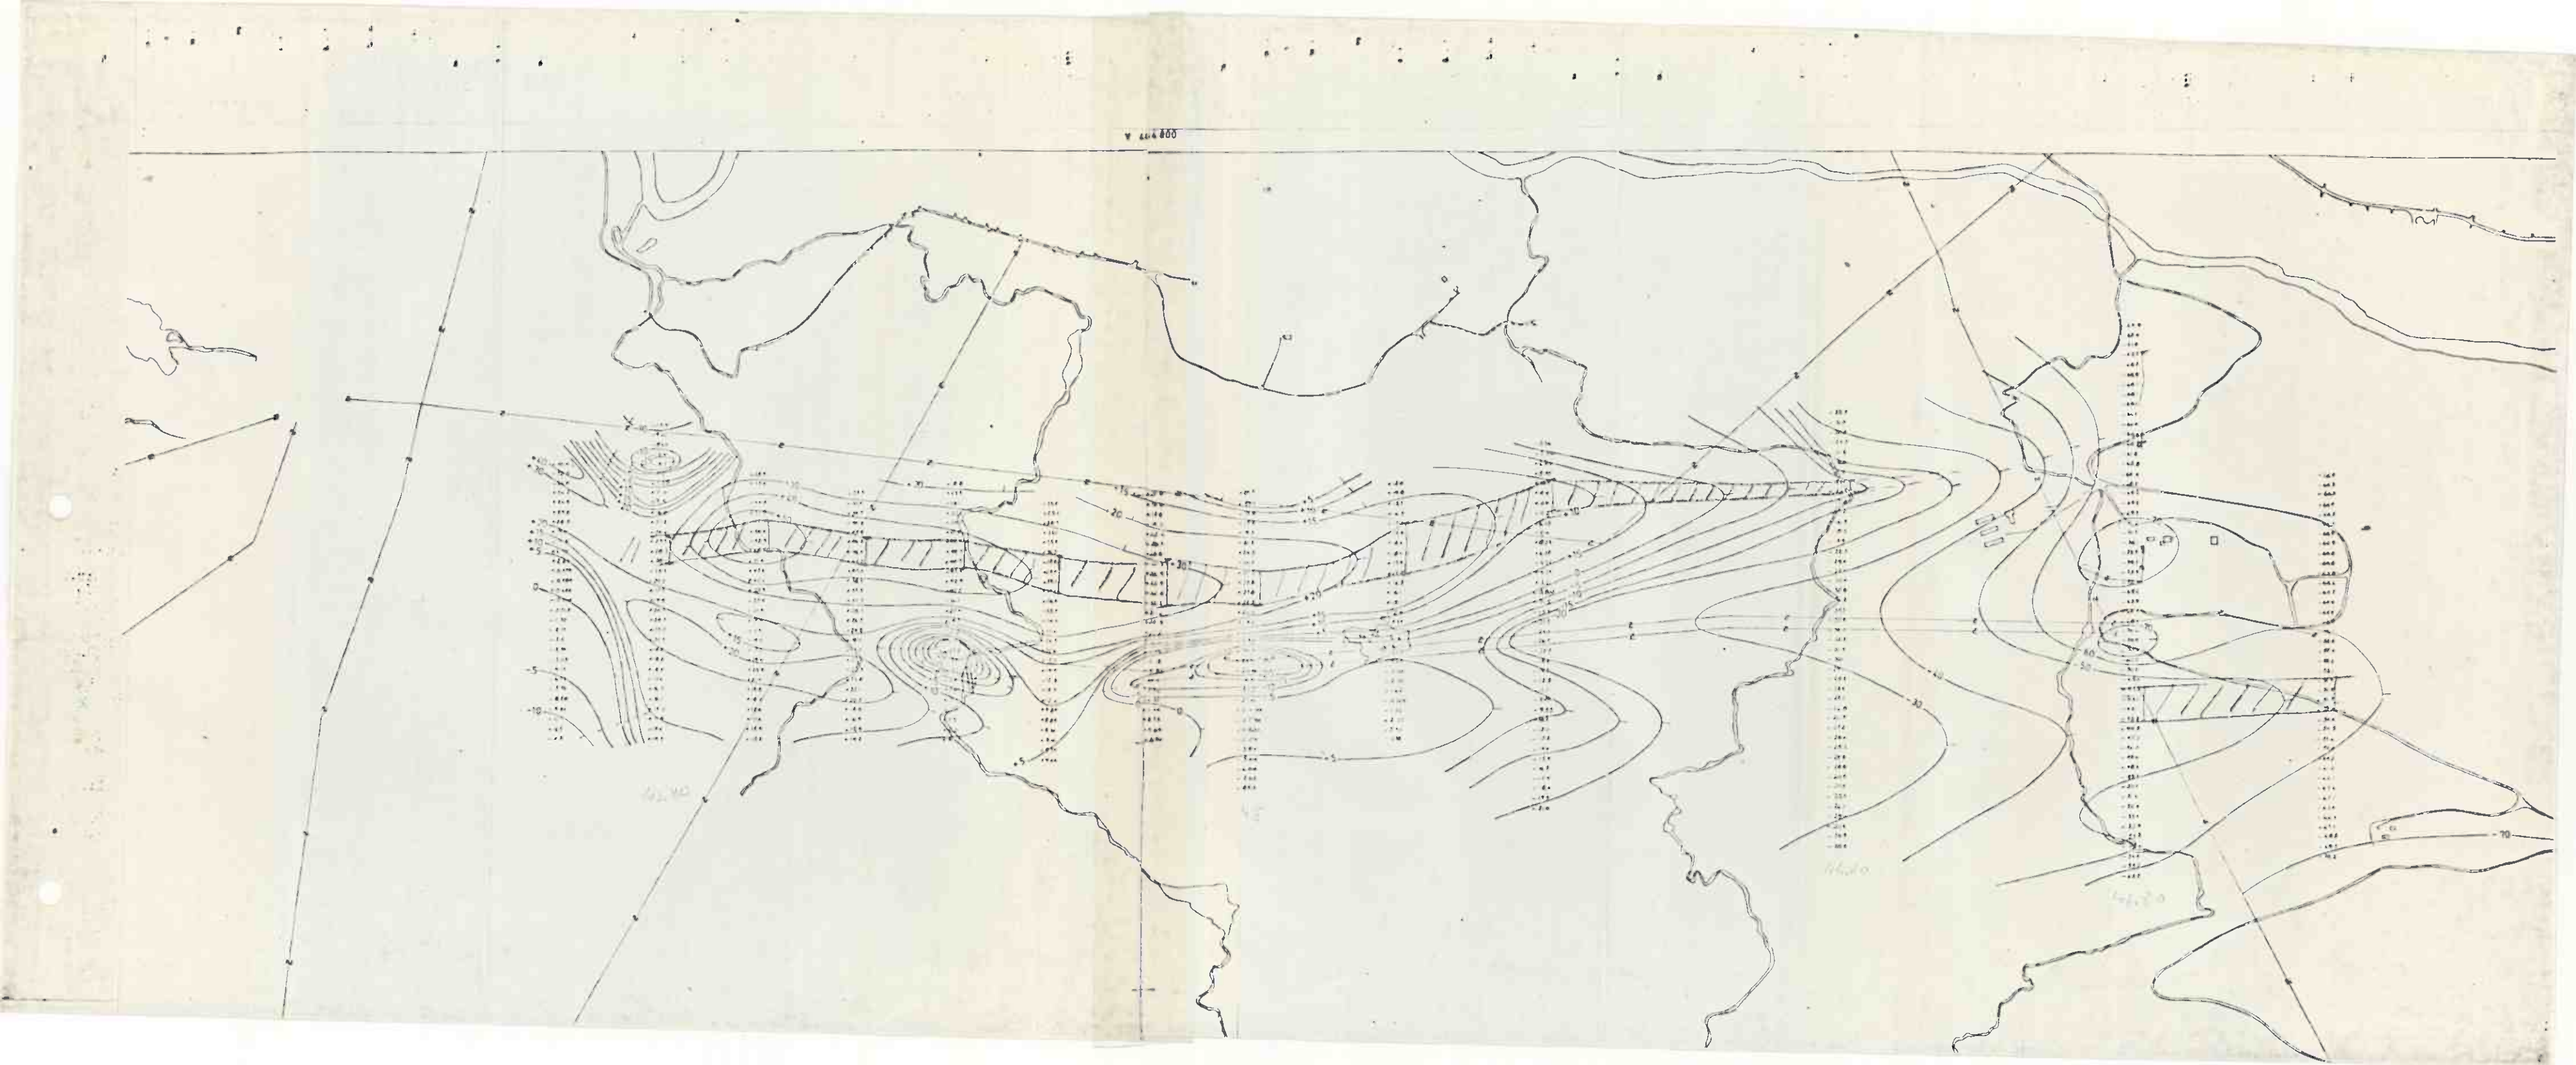
Att. chief geologist A Kruse

Dear Mr. Kruse,

I wish to thank you for our stay and discussions in Mo last week. On Friday I met among others Mr. Logn in Oslo and we had an opportunity to go through some self potential results. They correlated quite well with our CP results especially if we think of zone A. If we accept the idea that zone B is caused by the power line and try to eliminate the effect of this powerline we get a broad anomaly zone shaded in the enclosed map. The anomaly source could well be at the depth of some 300 meters and the asymmetry of the anomaly indicates a southern dip compared to the topography. Thus the shaded zone and anomaly A would represent the projection of the upper surface of the conductor to the ground. This conductor seems to vanish eastwards from profile y = 46.20. The short shaded zone in the east is difficult to explain.

At the same time we shall also send you the original CP-maps.

With best regards
SUOMEN MALMI OY


Pekka Mikkola
