Sammendrag

To områder ble valgt ut til Winkie boring, basert på anomale morenegeokjemiske verdier for Zn og Ag. Tre hull på tilsammen 51m ble boret på Ag anomalien og to hull på tilsammen 31,5m ble boret på Zn anomalien. Ingen lovende funn ble gjort og prosjektet ble nedprioritert.

From: J. B. Gammon

Subject:

Report No. 365/75/17. Zinc and Silver anomaly areas Salggangrid. Masi area.

The attached report summarises, for the record, winkie drilling results on two areas selected because of anomalous till-geochemistry values for Zn and Ag respectively. Nothing of promise was found and no further work is planned.

ADDITIONAL ACTIVITY
1:200 000

Introduction

These two areas are situated in the main Salggangrid, laid out in 1973, about one and a half km west of Javrehuosjavrre and about 2 kms south-west of Javrehuosjokka-grid. 2 detailed grids were laid out on geochemically anomalous areas. The northernmost was on a Ag-anomaly and called the Javrehuosjokka-W and the southernmost was on a Zn-anomaly and called the Javrehuosjavrre-W. The detailed till-sampling assays returned with

max Ag 5,8 ppm at 4600N/950W
max Pb 178 ppm at 4550N/950W
max Zn 480 ppm at 4750N/825W
from the silver-anomaly and
max Zn 1100 ppm at 3250N/900W
max Ni 312 ppm at 3250N/1050W
from the zinc anomaly.

Mapping, prospecting, Shoot-Back-EM-and Proxan-EM-surveys were done at both places. Five short prospecting Winkie-drill-holes were drilled on anomalous areas.

Geology (Fig.2)

Mapping was done by Per Ericsson. The Zn-anomaly is lying in a swampy area, where there was no outcrop to be mapped. The Ag-anomaly is lying on the eastern slope of a ridge on a very rusty and severally sheared graphitic schist. Above the schist on the top of the ridge there is a gabbroic rock and under the schist mica-schist and hornblendite, which are on another graphitic schist.

../2

Geophysics (Fig.3)

Shoot-Back-survey

The Shoot-back-survey was run with 50 ms' coil-separation. 3 strong and uniform anomalous zones were picked up on the Ag-anomaly zone. On the Zn-anomaly the strong EM-anomalies were more scattered on different profiles and did not form any uniform zone.

Proxan Survey

The Proxan is a one-man, shallow penetration EM-unit, made by Outokumpu's instrument division. It was loaned to Sulfidmalm for trials in Masi during the summer of 1975. The unit consists essentially of a rigid bar, ca. 1 m long, with sender and receiver coils mounted at opposite ends. The operating frequency is 50Hz. To carry out a survey the operator moves laong the profile, with the Proxan horizontal. A loud buzz indicates when the unit is passing over a conductor, and the operator then locates the conductor exactly using a field strength meter. Having located the conductor it is then possible to determine the depth of burial by taking field strength readings at three different heights (30 cms, 60 cms, 90 cms above ground level). Depth of burial is obtained by plotting these values on a special graph, and then matching against standard curves.

Due to the short coil separation the Proxan has a very limited depth penetration, and is primarily meant as an aid in boulder-prospecting. In shallow overburden areas it can be used to locate bedrock conductors, in which case the depth of burial data can be useful. At Salgganjokka for example, the depth of overburden estimates obtained from the Proxan survey agreed very well with the actual overburden depths encountered in the diamond drilling programme.

../3

Proxan survey results are presented in fig.3, sheet IV with Shoot-Back amplitudes.

Drilling and conclusions

Three vertical Winkie-holes were drilled on the Ag-anomaly:

9-W/1775 20.20 m at 4650N/990W
10-W/1775 20.50 m at 4550N/970W
11-W/1775 10.20 m at 4600N/990W

The holes were collared to test the source of the silver-anomaly in till and EM-anomalies. In the two first holes(9-W and 10-W) the rock was graphitic phyllite with some spahlerite and 20-30% pyrrhotite with traces of chalcopyrite. The best assays gave 0.6% Zn in 4 ms, 0.42% Ni in 2 ms and 5 ppm Ag in one meter. The hole number 11-W/1775 penetrated at first amphibolite, acid volcanics and chlorite-carbonate-schist before coming to the graphitic phyllite. The drilling had to be stopped at 10.20 m because of caving. The used equipments did not allow us to drill deeper than 20 ms. Therefore we could not drill through the mineralized graphitic rock.

Two vertical winkie-holes were drilled on Zn-anomaly:

12-W/1775 15.63 m at 3250N/1120W
13-W/1775 15.85 m at 3200N/ 970W

to find out a source of the Zn-anomalies in till and EM-conductors.

The rock-type in these holes was carbonate rich sandstone with some thin beds of graphite and po-breccia with traces of chalcopyrite. No visible sphalerite was found in the core. The EM-anomalies are supposely caused by graphitic and po-rich beds.

Salggangrid, Ag/Per Ericsson/1775

1. Rusty graphite-schist,

2. Graphite-schist, severely sheared and very rusty, S110/25S

3. Mica-schist with phenocrystals of almandin (?) and hornblende, S~horizonatal, somewhat rusty

a 4. Hornblendite, slightly sheared, S140/15S, 3% po

a 5. Graphite-schist, 5% py in s-places, B180/26W

6. Same as 5, B190/10E

7. Very rusty graphite-schist, sub-outcrop

8. Graphite-schist, 5% py, in s-planes, B40/10W

9. Gabbro, fresh but partly severly sheared and py/po-mineralized.

10. Gabbro, severly sheared, S190/24W, and albite/carbonate altered

11. Graphite-schist, very much py, suboutcrop

12. Graphite-schist, very tectonized, B40/10W general trend. Very rusty

13. Quartz/mica-schist

14. Gabbro, 0.5% py + po, S190/24W

../5

15. Gabbro

16. Very rusty graphite-schist, B90/24N

17. Rusty graphite-schist, B190/30W

18. Sub-outcrop of rusty graphite-schist

Proxan EM
4 Diamond drillholes

INGAJOKKA

MASI

KEY: HEM Conductors:
- Weak C-t 5-50
- Strong C-t 50-80
- Very strong C-t >80
- Limit of helicopter survey

Reconnaissance till Geochemistry Anomalies:
- Cu (>30ppm)
- Ni (>70ppm)
- Zn (>70 ppm)
- Limit of till geochemistry coverage.
- Mineralised outcrops
- Well-mineralised blocks
- Limit of Caledonide cover

- Sulfidmalm claims with number.
- Former Sulfidmalm claims, based on HEM anomalies dropped 1975.
- Detail survey grids
- Ground EM anomalies
- Diamond Drillholes.
- R Gossan.
